Studies of Coastal Oceans

Evaluating MPAs

**Why
Where
How
What
When**

Why Evaluate MPAs?

1. Required by MLPA

The law requires that the master plan include “[R]ecommendations for monitoring, research, and evaluation...to assist in adaptive management of the MPA network...” (FGC Section 2856(a)2(H))

2. Adopted Goals of the Central Coast Regional Stakeholder Group

Goal 5 - 2. ...develop objectives, a long-term monitoring plan that includes standardized biological and socioeconomic monitoring protocols, and a strategy for MPA evaluation...

3. Given limited resources, any management approach comes with costs:

- detracts from alternative approaches
- redirects resources (financial and human)

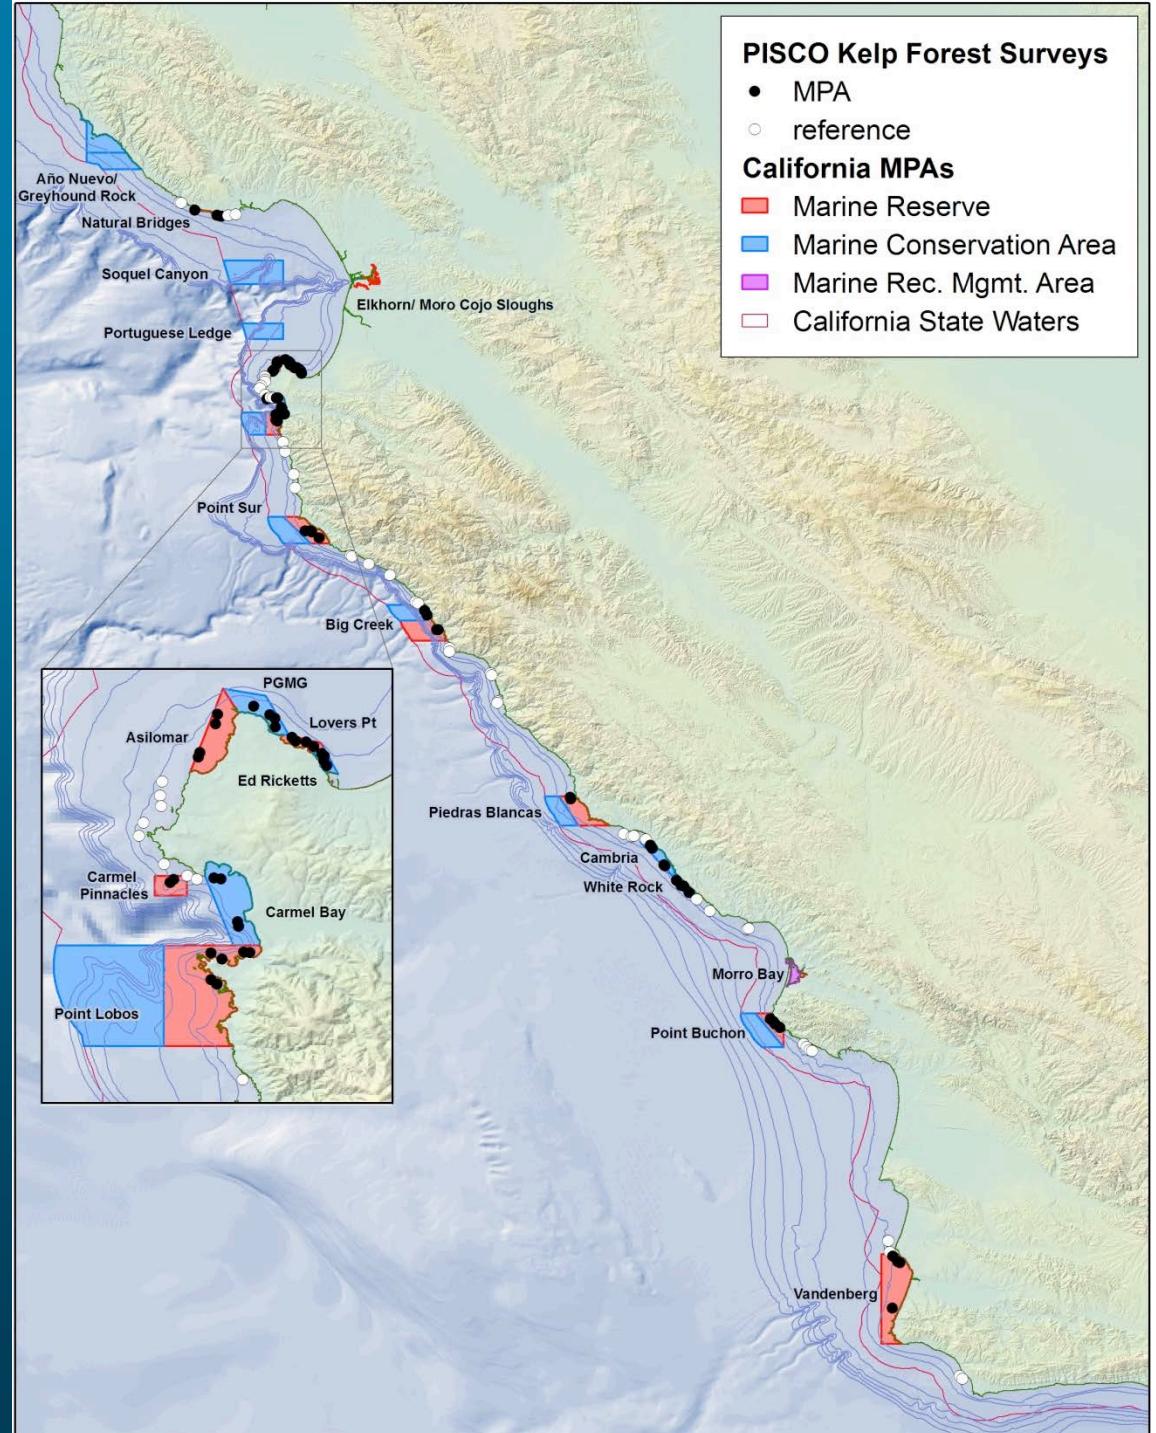

Why Evaluate MPAs?

4. **If ineffective and without evaluation, provides false sense of security**
 - jeopardizes resource, especially if other existing regulations are relaxed
5. **Critical to refining design and adaptive management:**
 - the sooner benefits/costs determined, the more rapidly aspects of design can be refined
6. **Goals common to evaluation and application**
 - e.g., EBM and fisheries application

Where do you Evaluate?

Diving surveys
2007-2008

Where do you evaluate?

 Inside MPAs

 Inside vs. Outside MPAs

 Among Multiple MPAs

PISCO Kelp Forest Surveys

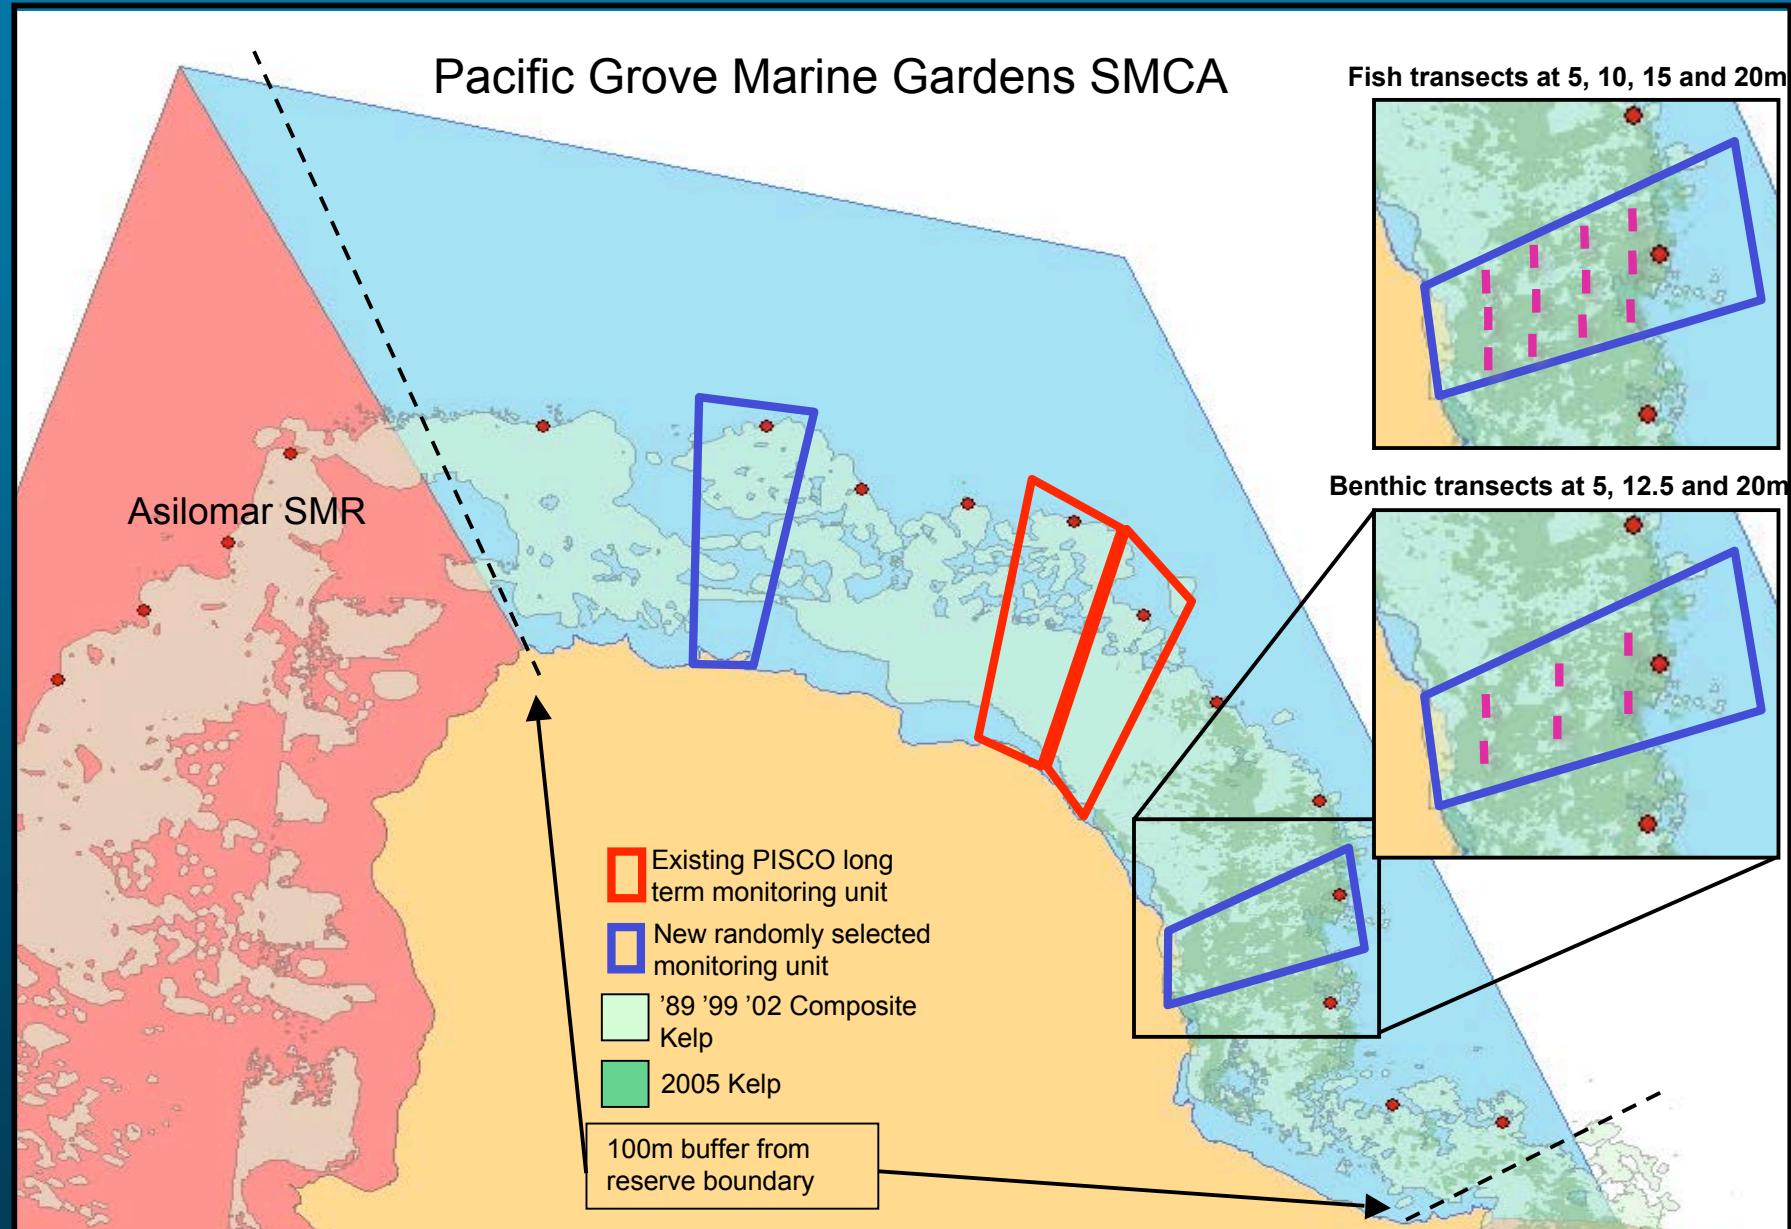

- MPA
- reference

California MPAs

- Marine Reserve
- Marine Conservation Area
- Marine Rec. Mgmt. Area
- California State Waters

Where do you evaluate?

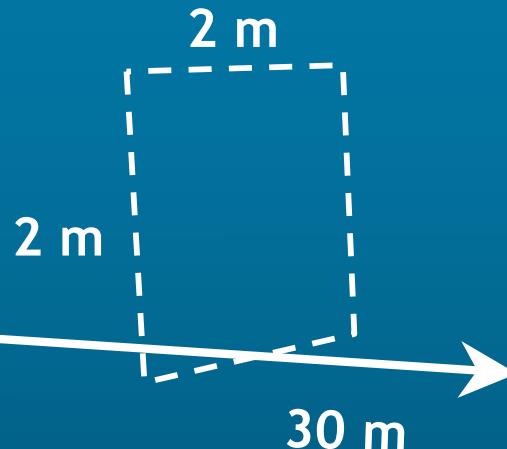

Example schematic diagram of stratified random permanent sampling design.

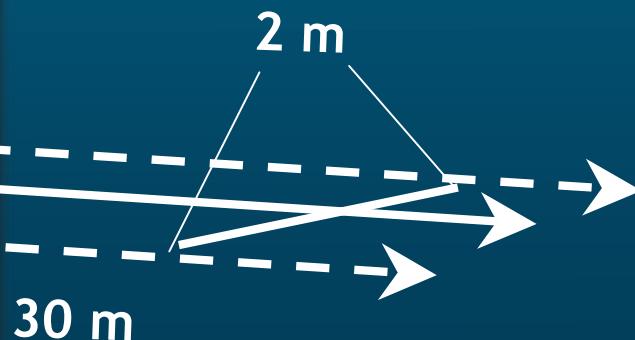

How do you evaluate?

Fish: density & sizes

Kelps & large mobile inverts:
density

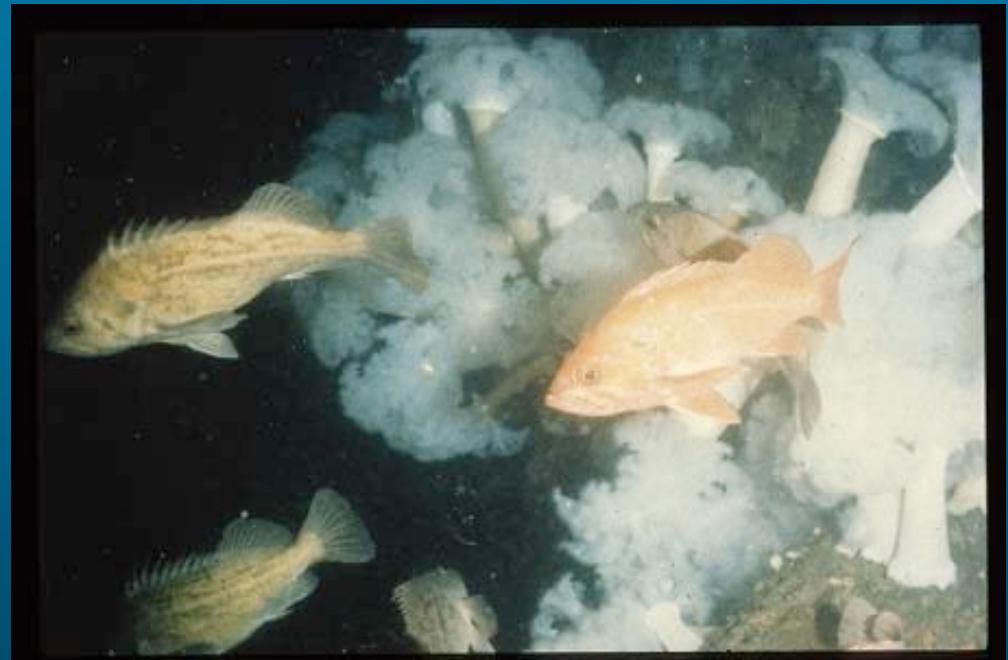

Algae & inverts: % cover

What do you evaluate?

Depends on **goals and objectives** of MPA:

conservation

- biodiversity
- structure and function of ecosystem

fisheries management

- buffer, spawning source (replenish unprotected populations)
- baseline, reference areas to distinguish human impacts from natural variation

What do you evaluate?

Ecological Parameters to estimate:

Population

Community

Ecosystem

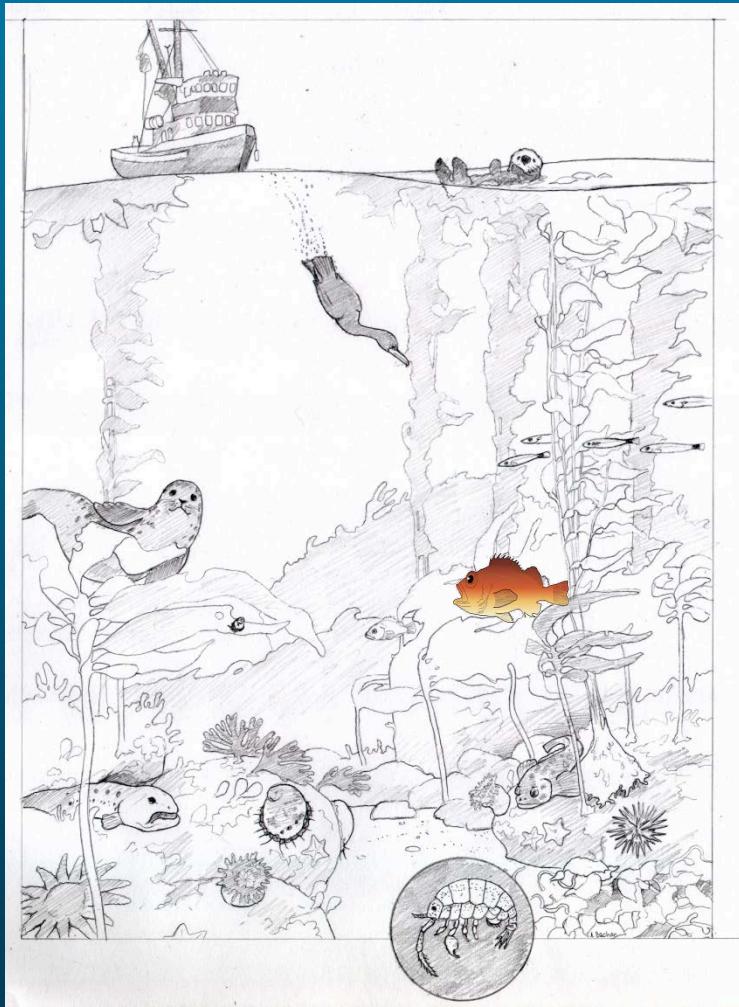

Structure

Function

What do you evaluate?

Parameters to estimate:

Population

- size / age structure
- larval production
- density (i.e. abundance)
- ecological role

Community

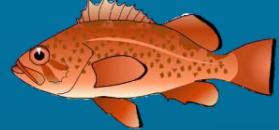

- structure: diversity, composition
focal species (threatened, indicator)
- function: keystone, trophic and other
interactions, habitat engineers

Ecosystem

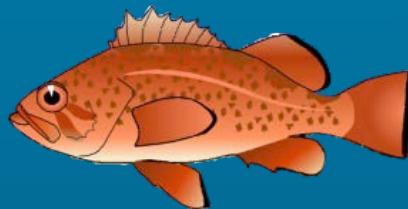

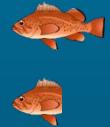

- productivity, connectivity

Why Measure size?

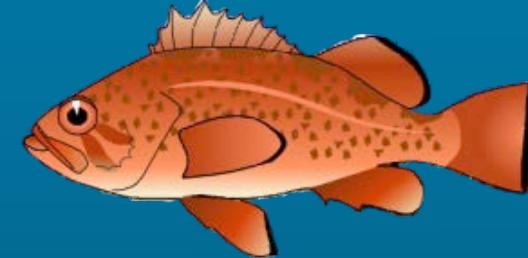

Vermilion Rockfish, *Sebastodes miniatus*

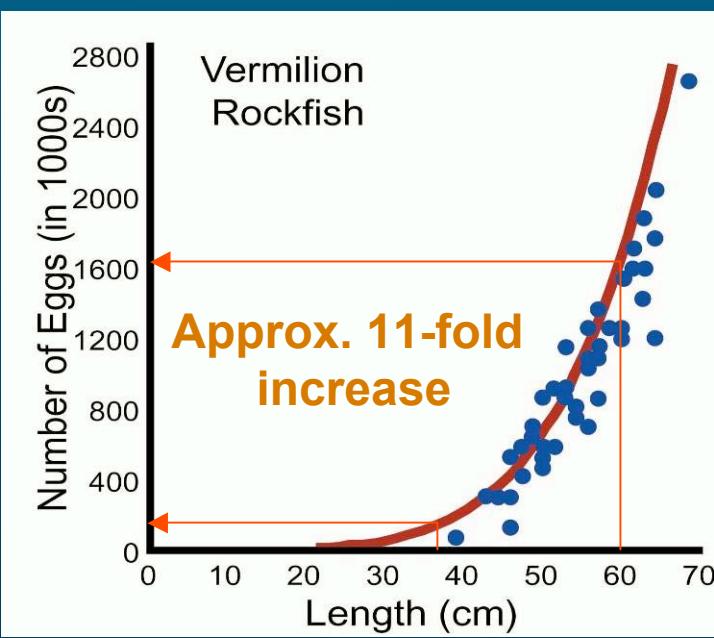

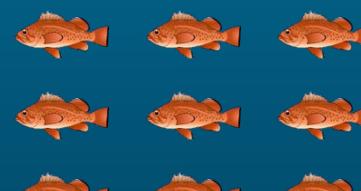

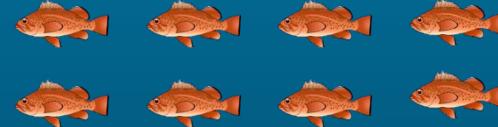

37 cm, 0.8 kg

50 cm, 1.9 kg

60 cm, 3.3 kg

 = 100,000 babies

Love et. al. NOAA Tech. Rep. 1990

What do you evaluate?

Parameters to estimate:

Population

- density (i.e. abundance)
- size/age structure
- larval production
- trajectory of population size

Community

- structure: diversity, composition
focal species (threatened, indicator)
- function: keystone, trophic and other
interactions, habitat engineers

Ecosystem

- productivity, connectivity

Attributes of Ecosystems - To Evaluate

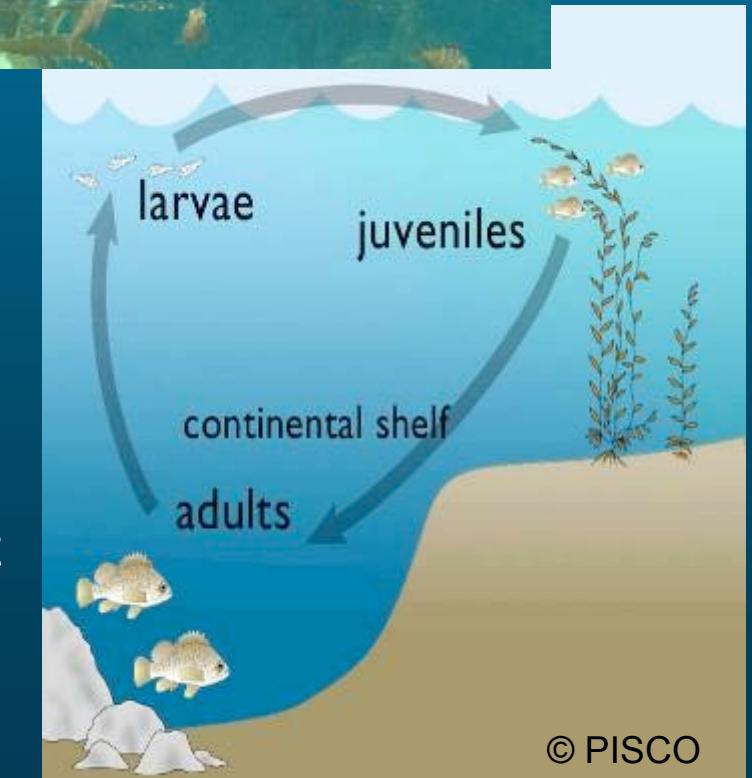

Structure

- Similar to community structure plus habitat structure

Functions

- Productivity
- Trophic interactions
- Other species interactions (e.g., kelp produces habitat)
- Nursery habitat
- Connectivity - larval production and export

When do you evaluate?

Evaluation - Conclusions

- Complex, costly, but these are relative and doable
- Must be initiated as quickly as possible
- Must have realistic expectations of rate, scale and magnitude of responses
- Multiple MPAs are better than one
- Must respond to feedback adaptively
- Requires multiple sampling approaches
- Requires collaboration among agency, academia, and user groups
